29 October 2021

Executive Summary

ID Land Pty Ltd (ID Land) has engaged Golder Associates Pty Ltd (Golder) to undertake a Preliminary Site Investigation (PSI) for the property at 89 Ross Watt Road, Gisborne (site). ID Land has acquired the site and proposes to develop the site for residential land use. The assessment included a site information and history review, site walkover and shallow soils sampling.

The site has a history of residential and agricultural use including potentially grazing and cropping of the land. Existing structures at the site include homestead infrastructure (house, shed, water tank) at the northeast boundary, the footprint of which has changed over time but within the same area on the site and general soil stockpiles, concrete slab, waste burning area and dams identified in the north-west portion of the site. No evidence of extensive use of imported fill or excavation was identified. Surrounding land use has been and remains agricultural or residential in nature with a former quarry located adjacent to the western site boundary.

All soil samples have reported concentrations below the adopted human health criteria for residential and public open space use indicating the site represents a low risk for the proposed residential land use. As access has not been granted to the homestead area where some of the key features of interest are there will remain a level of risk of contamination that cannot be assessed at this time.

The risk of groundwater contamination at the site is low. Furthermore, the risk of contamination impact to the site from offsite sources is considered to be low as no potentially contaminating activities were identified in the immediate surrounding areas.

Based on the findings of the site desktop assessment and the soil investigation, no contamination issues have been identified that are likely to preclude the proposed development of the site for a residential use.

Given the low risk of contamination identified it is likely that the near surface soil across the majority of the site is likely to classify as Fill Material for the purposes of offsite disposal. Concentrations of fluoride in the stockpile near the large dam may classify it as Category C waste for offsite disposal subject to further assessment. Further sampling of soil stockpiles identified on site in the northwest should be undertaken to classify the stockpiled materials should these stockpiles be proposed for on-site reuse or off-site disposal.

When considering the environmental process to be used to progress site development, consideration must be made of the requirements of *Ministerial Direction No.1 – Potentially Contaminated Land* that requires planning authorities to satisfy themselves that the environmental condition of the land to be used for a purpose is, or will be, suitable for that use. In our assessment there is a low risk of contamination at the site which can be managed through the implementation of the recommendations set out in this report. As such, it is unlikely that further assessment will be required by the Planning Authority other than this assessment and completion of the recommended actions.

As specified in the Environment Protection Act (2017) which came into effect on 1 July 2021, the Duties for Contaminated Land apply to anyone in management or control of contaminated land. Based on the information to date, no contamination has been identified at the shallow soils across the site. As such, in our opinion the site is unlikely to be defined as contaminated land so that the GED would apply to the party in control of the land.

The following actions are recommended prior to or as part of development:

- Assessment of soil condition within the fenced homestead area in the north eastern portion of the site be undertaken through a program of shallow soil sampling to better assess soil condition around the site infrastructure and the need for remediation.
- Further sampling of soil stockpiles identified on site in the northwest should be undertaken to classify the stockpiled materials should these stockpiles be proposed for on-site reuse or off-site disposal.
- Once access is available, a HAZMAT survey should be undertaken at the homestead infrastructure area, and any identified ACM or other hazardous materials should be removed from site and disposed should demolition of the homestead infrastructure area be proposed. Following demolition of infrastructure, soil beneath the footprints should be inspected for signs of visual contamination or odour as validated by an Environmental Consultant.
- Identified anthropogenic materials (i.e. burnt, rusted drums and concrete slab in the northwest portion of the site) and other wastes if identified should be removed from site and visually verified as having been removed.
- There will remain a level of uncertainty in relation to past activities over the site. It is therefore recommended that the uncertainty in the residual risk of contamination is managed via a general soil management protocol to be adopted during the development of the site. The protocol would note:
  - The GED in relation to parties in control of the site;
  - Should any stained or odorous soils or soils containing waste be identified, that these are assessed by an Environmental Consultant;
  - All material suspected of being ACM should be assessed by a suitably qualified practitioner. Any ACM should be handled and disposed of by a suitably qualified and licenced asbestos contractor;
  - Any soil brought to site as fill are confirmed as meeting the EPA requirements for Fill Material; and
  - Any soil taken off-site meets the EPA requirements for the off-site disposal of soils.

Important Information Relating to this Report

1.0 INTRODUCTION

ID Land Pty Ltd (ID Land) has engaged Golder Associates Pty Ltd (Golder) to undertake a Preliminary Site Investigation (PSI) for the property at 89 Ross Watt Road, Gisborne (site). ID Land has acquired the site and proposes to develop the site for residential land use. The site currently consists of agricultural land, a residential building with external sheds, and three dams. The site is shown on Figure F1 with the proposed masterplan illustrated on Figure 1 below.

Figure 1: Proposed Masterplan (the site) (Breese Pitt Dixon, October 2021)

2.0 OBJECTIVES

The objectives of the environmental site assessment are to:

- Assess the nature of the previous and existing land uses of the land; and
- Undertake intrusive soil sampling to evaluate the potential for contamination that may impact upon the proposed development.

As access has not been granted to the homestead area in the north east of the site (Figure F1) where some of the key features of interest are there will remain a level of risk of contamination that cannot be assessed at this time.

3.0 INFORMATION REVIEW

3.1 Sources of Information

The assessment included a desktop review of historical information and site walkover.

The following sources of information were included in the desktop assessment:

Historical certificates of title

As part of the review Golder reviewed historical and current certificates of title for the site. Certificates of title can provide an indication of who has previously purchased the property, for what purpose and for what duration. Reviewed certificates of title are provided in Appendix A.

Aerial photographs and Historical Maps

Historical aerial photographs from 1984 through to 2021 were reviewed. Aerials from 2010 onwards were sourced from Nearmap. Aerial photographs provided an overview of property development over time, including the type of buildings and site coverage.

Environment Protection Authority (EPA) Priority Sites Register

EPA Priority Sites are sites for which EPA has issued a Clean-Up Notice pursuant to section 62A or a pollution abatement notice pursuant to section 31A or 31B (relevant to land and/or groundwater) of the *Environment Protection Act 1970* (now superseded). The most recent register was published on 31 May 2021. The register can provide an indication of whether the site or surrounding sites have been identified as contaminated.

Environment Protection Authority (EPA) Environmental Audit Statements and Certificates Register

EPA provides an online interactive portal for sites that are or have been under environmental audit. A review of Environmental Audit reports for premises in the vicinity of the site can provide information on area and site history, regional and local geology and hydrogeology and potential for the site or surrounding sites to be contaminated or pose a risk of contamination.

EPA Map of Groundwater Quality Restricted Use Zones in Victoria

EPA provides an online map of groundwater quality restricted use zones (GQRUZ) in Victoria. A GQRUZ is an area where, following an audit, there is remaining groundwater pollution. The GQRUZ is identified when attempts have been made to clean up the groundwater and EPA determines that restrictions should remain on how the water can be used without further treatment. The GQRUZ acts as a tool to inform potential users of groundwater that the water may not be suitable for the intended use due to remaining pollution and that testing of the groundwater is required to assess its suitability.

Geological and hydrogeological information

The Geological Survey of Victoria provides information regarding regional geology and hydrogeology. The estimated depth of groundwater and depth to rock provides context within which to evaluate the likely behaviour of contamination in the local environment.

Data obtained through the desktop investigation has been collated, evaluated and presented in this report.

3.2 Site Details

Table 1: Site Location and Setting

Item	Description
Address	89 Ross Watt Road, Gisborne
Legal Description	Lot A PS318022 Lot 1 TP844764
Approximate Site Area	860,000 m^2
Council	Macedon Ranges Shire Council
Current Zoning	General Residential Zone (GRZ) General Residential Zone – Schedule 1 (GRZ1)

Item	Description
Planning Overlays	Development Plan Overlay (DPO) Development Plan Overlay – Schedule 4 (DPO4) Development Contributions Plan Overlay (DCPO) Development Contributions Plan Overlay – Schedule 2 (DCPO2) Land Subject to Inundation Overlay (LSIO)
Current Site Use	Residential – Single story dwelling Agricultural – Open farmland
Site Features	This site contains open farmland with a fenced off homestead area in the north east region of the property. The homestead area contains an external shed and single residential dwelling. Three dams are located across the property.
Surrounding Land Use	North – Agricultural with small residences and Gisborne Nature and Conservation Reserve directly to the north east. East – Residential estates, Swinburn Avenue Children's Centre directly to the east. South – Jackson Creek and then agricultural with small residences West – There is a former quarry adjacent to the western corner of the site beyond which is Rosslynne Reservoir.

3.3 Geology, Soils and Hydrogeology

The environmental site setting is summarised in **Table 2**.

Table 2: Environmental Setting

Summary Information	Details
Topography	The site is generally flat with topographic lows (approximately 455 m) along the south-western boundary and topographic highs (approximately 470 m) along the north-western boundary.
Nearest Surface Water Bodies	There are three surface dams located on the site and several other dams located on surrounding properties. The nearest major surface water features are Rosslynne Reservoir to the immediate west of the site and Jackson Creek which marks the southern boundary of the site.
Surface Water Segment	The Environment Reference Standard (GoV, 2021) (ERS) indicates the site is located within the 'Central Foothills and Coastal Plains' Segment. The beneficial uses to be protected within this Segment are outlined in the ERS.
Regional Geology	The Geological Survey of Lancefield Mapsheet (1:50,000 scale) shows that the site is located on basalt of the Newer Volcanic Group.
Potential Acid Sulphate Soils	The site lies within an area with an extremely low to low probability of occurrence of acid sulphate soils.
Regional Hydrogeology	Based on a review of Visualising Victoria's Groundwater (VVG) database, groundwater beneath the site is likely to be present at a depth of 10 m to 20 m in the north east and 20 m to 50 m across the rest of the site.
Groundwater Segment	Groundwater quality in the region is expected to have a total dissolved solids (TDS) concentration in the range 500 mg/L to 1,000 mg/L in the southeastern portion of the site, and 1,000 mg/L to 3500 mg/L in the northwestern portion of the site. The Environment Reference Standard (GoV, 2021) (ERS) classifies

Summary Information	Details
	this TDS range as A2 to C, and would generally be regarded as A2 for the site.
Regional Groundwater Use	The Visualising Victoria's Groundwater (VVG) database indicates the presence of 13 wells within 1000 m of the site homestead area. Five are licenced for groundwater investigation and six do not have a stated use. Two including the closet well to the site are licensed for domestic and stock use, are located 650 m and 1,000 m north of the site being drilled to a depth of 146 m and 47 m respectively. The well depths range from 25 m to 146 m.
Inferred Groundwater Flow	An Audit report for a nearby property indicates groundwater flow in a southerly direction, towards the Jackson Creek. Nearby geological or man-made features may also influence groundwater flow on a local scale.

3.4 Site History

A review of available historical maps, aerials and photographs was undertaken to ascertain the nature of the land uses previously occupying the site. A summary of observations is provided below, referenced images are presented in Appendix B.

An 1857 map of the Subdivision of Allotments, by the Public Lands Office indicate that the north-east region of the site was "good agricultural land". The western area of the site is labelled "Watt's Pre-Emptive Right" and is assumed to be green field pre-agricultural (Figure 2).

Figure 2: Extract of Township and suburban allotments of Gisborne, City of Bourke – 1857 (SLV Identifier: 44887680)

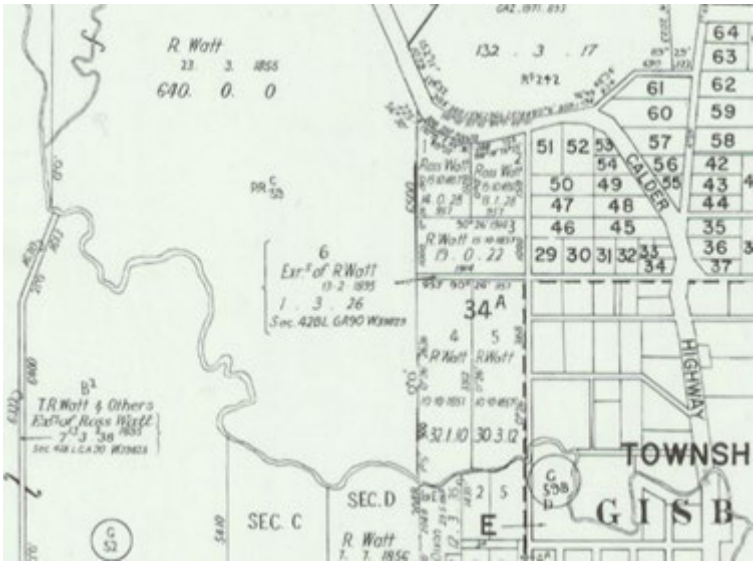

Figure 3: Extract of Gisborne, Country of Bourke – 1973 (SLV Identifier: 44887673)

Figure 3 indicates that by 1973 the site was owned by T.R. Watt & Others, as an extension of the original purchase by R Watt in 1856 (Figure 2) and additional land purchase in 1895 comprising the remainder of the site.

Historical aerial imaging indicates that by 1950 the site was pastoral. By 1984, a (alluvium) quarry is present adjacent the western site boundary and a small dam is present in the eastern part of the site (Figure 4). By 1989 (Figure 5) the original dam has been enlarged and an additional dam is present in the south of the site. The residential building, an associated shed and outbuildings are present in the northeastern part of the site. Stockpiles of soil are present in the northwest corner of the site. Initial construction has begun on the residential estate to southeast of the site.

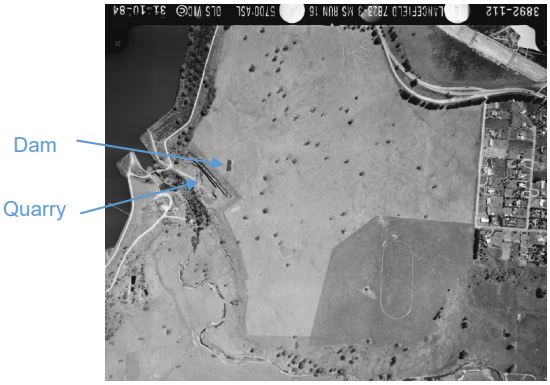

Figure 4: Aerial Photograph 1984

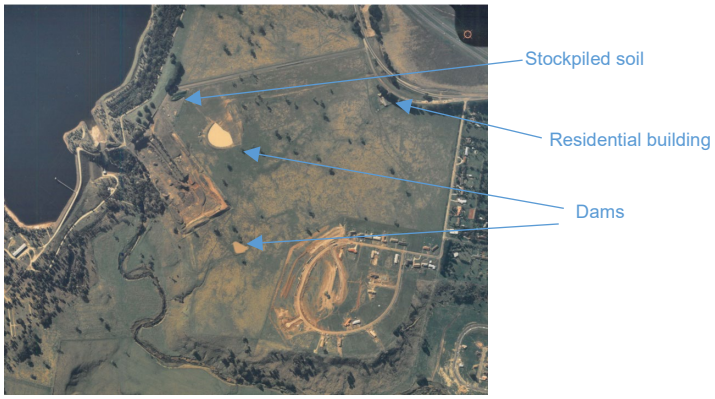

Figure 5: Aerial Photograph 1989

By 2010 a childcare centre had been built in the eastern corner of the site. The residential estate to the southeast of the site was completed.

As shown on Figure 6 the layout of the homestead area was dynamic. The main house and shed were present in 1989. A small structure was built in the southern corner by 2010, which had been enlarged by 2012 and removed by 2015. Additional structures were present adjacent to the main shed by 2015 and had been extended by 2017 and removed by 2021.

Figure 6: Homestead Area 1989 - 2021

3.5 Regulatory Review

3.5.1 EPA Victoria Priority Sites Register

The most recent Priority Sites Register (PSR) does not list the site however a Priority Site (PS) is located within 1 km of the site.

The PS located at 9 Station Road, Gisborne is a former petroleum storage site located approximately 850 m southeast of the site boundary. The PSR status is “Requires assessment and/or clean up”.

3.5.2 EPA Groundwater Quality Restricted Use Zones (GQRUZ)

The site is not, nor are the immediately surrounding sites, within an EPA GQRUZ.

3.5.3 EPA Victoria Environmental Audits

Two environmental audits under Section 53X of the Environment Protection Act 1970 (now superseded) are located within 1 km of the site. The closest audit site is located at the Former VicRoads Patrol Depot, Old Calder Highway, Gisborne (SKM, 1995), located approximately 350 m to the east of the site. The result of the environmental audit was a Certificate of Environmental Audit indicating that the condition of the site was neither detrimental nor potentially detrimental to any beneficial uses of the site.

The second site subject to environmental audit is located approximately 550 m to the southeast of the site at 108 Acacia Court (Camp Scott Furphy, 1993). The audit site was formerly a sheep dip. The result of the environmental audit was a Certificate of Environmental Audit indicating that the condition of the site was neither detrimental nor potentially detrimental to any beneficial uses of the site.

4.0 SITE INSPECTION

A site inspection was undertaken on 17 June 2021. Access was granted to external areas only, and did not include access to the fenced area containing the homestead area, associated shed and garden area. A selection of photographs taken during this site inspection presented in Appendix C. The main features within the homestead area are shown on Figure 7 below.

Figure 7: Homestead Area (Nearmap 2021)

The homestead area includes a single storey brick built house (Appendix C, Photograph 1) with an attached water tank. The homestead area is grassed with mature trees and shrubs. Due to the age of the residential building there is a possibility that it was constructed utilising asbestos containing material (ACM).

A large metal shed is located to the northwest of the main house with an attached water tank (Appendix C, Photograph 2). There is a burn area to the west of the shed (Appendix C, Photograph 3) and a greenhouse and 2 small metal containers to the west of the main house (Appendix C, Photograph 4).

The surrounding paddocks contained long grass with occasional trees (Appendix C, Photograph 5). Cattle were present on-site (Appendix C, Photograph 6). A concrete tank assumed to contain water is present in the northwest corner of the pasture (Appendix C, Photograph 7). Burnt out, rusted 205 L drums (Appendix C, Photograph 8) were found in the north western part of the site as were piles of earth which appeared to be natural materials but had no obvious function (Appendix C, Photograph 9 and 10).

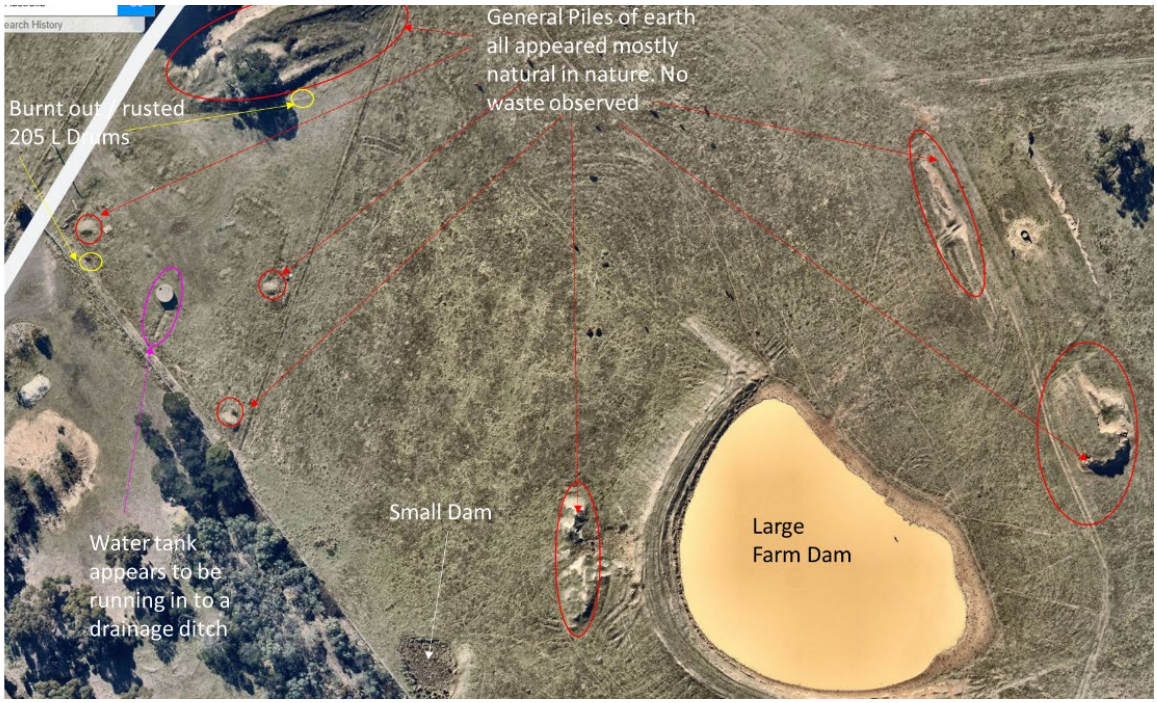

Figure 8: Northwestern Corner of Site (Nearmap 2021)

5.0 POTENTIAL CONTAMINATION RISK

The desktop site history review and inspection assessed the potential for past and current activities on the site to have resulted in contamination. The following table presents a summary of potential sources of contamination, details on potential contaminants that may be associated with these areas and provides a relative risk ranking for investigation of each item with respect to contamination at the site. It should be noted the risk ranking is not intended to infer severity or extent of impact; rather, it is the intention to indicate the potential for the contamination issue to exist at the site.

Table 3: Summary of Potential Sources, Contaminants and Risk Ranking

Activity	Description	Indicative Potential Contaminants	Contamination Risk	
			Soil	Groundwater
On-Site Land Use				
Agricultural Use / Grazing	Site was subject to agricultural purposes, potentially grazing and cropping but may have included the use of pesticides.	OCP and OPP, nitrates and phosphates	Low	Low
Residential Use	General residential use, demolition and construction of various structures. Septic tank, possible generator use.	Asbestos, Metals, PAHs, Nitrates and Phosphates	Low	Low
Sheds	Storage and handling of common farming and machinery chemicals has the potential for exposure to the environment, giving rise to shallow soil and groundwater contamination. Given the ad hoc nature of storage and housekeeping, soil impact may be spread around the shed.	Broad range of potential contaminants, including: Asbestos, metals, PAH, TPH, OCP and OPP, nitrates and phosphates	Low to Moderate	Low
Wastes	Waste stockpiles and burning of waste evident; drums in north western portion of site.	Metals, PAH, Asbestos, waste	Low	Low
Off-site Land Use				
Agricultural and residential use	The surrounding area has generally been utilised for agricultural purposes with residential developments increasing.	Metals, PAHs, OCP and OPP, nitrates and phosphates	Low	Low
Priority Sites	Former service station 850 m to south east requiring assessment and/or clean up. Inferred down hydraulic gradient of the site.	Metals, TPH, solvents	Low	Low
Quarry	A former quarry is present to the adjacent to the western site boundary. Potential waste or soil deposition.	Broad range of potential contaminants or influence on groundwater dynamics	Low	Low

Notes:
PAH Polycyclic Aromatic Hydrocarbons *MAH Monocyclic Aromatic Hydrocarbons* *TPH Total Petroleum Hydrocarbons* *S/VOC Volatile or Semi Volatile Organic Compounds*

6.0 SOIL ASSESSMENT

6.1 Methodology

To assess the potential contamination status of the site, soil samples were collected from eight hand augered sample locations from across the site. No access was granted within the fenced homestead area in the northeast portion of the site, at the time of sampling. In addition, no sampling was undertaken in the far south of the site as the area was considered to represent a similar or lower contamination risk profile to the northern areas away from the farm infrastructure. A plan of the sample locations is provided on Figure F1 attached.

The Australian Standard AS4482.1-2005 Guide to the sampling and investigation of potentially contaminated soil, Part 1: Non-volatile and semi-volatile compounds suggests 55 Sampling Points per 5 ha (~945 samples for 85.91 ha), however, given the likely low risk of the site contamination, and low to moderate risk around the homestead area, the proposed approach of confirmatory sampling was considered sufficient to assess the site contamination risk. The homestead area will be assessed at a future date.

Golder notes that sampling locations HA01, HA03 and HA04 in the north-west portion of the site were hand-augered on top of the soil stockpiles/mounds. Also, a concrete slab was identified in the north-west corner of the site. This structure may be associated to the former quarry located adjacent to the western site boundary. Soil sample HA02 was taken adjacent to the identified concrete slab.

Soil sampling was undertaken on 27 August 2021. Samples were logged in the field and assessed for the potential presence of visual or olfactory evidence of contamination. Samples were collected in jars supplied by the laboratory and Nitrile gloves were worn whilst collecting samples and changed after collection of each soil sample. The jars were labelled immediately and stored in a chilled cool-box. The samples were then dispatched to the laboratory accompanied by Chain of Custody (CoC) documentation.

A total of nine primary soil samples, one duplicate quality assurance (QA) sample and one rinsate blank QA sample were submitted for laboratory analysis (Appendix F).

The nine primary soil samples were selected for the following analysis:

- Five samples were tested for the suite of chemicals in Table 3 of the Victorian Environment Protection Authority (Vic EPA) Waste Guidelines Publication 1828.2 (June 2021).
- Four samples were tested for a reduced suite of analytes including metals, polycyclic aromatic hydrocarbons (PAHs) and pesticides (organochlorine and organophosphorus) concentrations.

Samples were submitted to the nominated primary laboratory, Eurofins, which is registered by the National Association of Testing Authorities (NATA) for the analyses performed. The laboratory certificates and CoC documentation are provided in Appendix F.

6.2 Soil Assessment Framework

Soil assessment criteria has been selected based on the proposed low to medium density residential use of the site.

6.2.1 Criteria for Environmental Values

The ERS (GoV, 2021) outlines land use categories and specifies environmental values which must be protected for each of these categories. In accordance with the ERS (GoV, 2021), the relevant environmental values of land that must be protected based upon the proposed land use at the site are presented in **Table 4**.

Table 4: Protected Environmental Values of Land

Environmental Values	Land Use Category: Sensitive use – Other
Maintenance of ecosystems *Natural ecosystems* *Modified ecosystems* *Highly modified ecosystems*	 No Yes Yes
Human health	Yes
Buildings and structures	Yes
Aesthetics	Yes
Production of food, flora and fibre	Yes

The ERS (GoV, 2021) outlines indicators and objectives for land, based on the relevant environmental values. The adopted soil assessment criteria considered applicable for low density residential land use are discussed in the following sections and are summarised in **Table 5**.

Table 5: Summary of Adopted Assessment Criteria for Soil

Environmental Values	Land Use Category: Sensitive use - Other
Maintenance of ecosystems *Highly modified and modified ecosystems*	NEPM 2013 EILs - Urban Residential and public open space NEPM 2013 ESLs - Urban Residential and public open space, fine soil
Human health	NEPM 2013 HIL-Residential A Soil NEPM 2013 Residential A & B Soil HSL for Vapour Intrusion, silt NEPM 2013 Management Limits – Residential, fine soil
Buildings and structures	Australian Standard AS2159-2009
Aesthetics	Field observations of visual and olfactory impacts
Production of food, flora and fibre	NEPM HIL-A investigation levels have been adopted.

NEPM - National Environment Protection (Assessment of Site Contamination) Measure (NEPM) 2013, EILs – Ecological Investigation Levels, ESLs – Ecological Screening Levels, HILs – Health Investigation Levels, HSLs – Health Screening Levels

Site-specific EILs were derived for copper, chromium III, nickel and zinc by adopting the soil properties for the Australian reference soil presented in Table 12 of Schedule B5b (NEPC 2013) including: clay content of 10%, a cation exchange capacity of 10 cmol/kg and an organic carbon value of 1%. For pH, the average of soil pH values (6.8) obtained from laboratory analysis of collected samples was used. The EILs were then derived by inputting these values in the EIL calculation spread sheet provided in NEPC (2013) where aged soil and low traffic volume was assumed. These are presented in Appendix F.

6.2.2 Waste Classification Criteria for Offsite Disposal

In Victoria, waste must be classified to meet waste duties under Part 6.4 (Duties relating to industrial waste) and 6.5 (Duties and controls relating to priority waste) of the *Environment Protection Act 2017*.

The *Environment Protection Regulations 2021* (the Regulations), Part 4.2 (Industrial Waste and priority waste) specifies the process for classifying waste.

EPA Victoria (2021) *Waste Disposal Categories – Characteristics and Thresholds* (Publication 1828.2), details the characteristics and thresholds necessary for complying with the Regulations, specifically, classification of wastes to determine the relevant priority waste category in accordance with Schedule 6 of the Regulations.

The relevant priority waste category must be identified for priority waste consigned for disposal to landfill or for soil that is priority waste. The priority waste categories are:

- Category A waste - prohibited from disposal to landfill
- Category B waste
- Category C waste
- Category D waste - for soil only
- Soil containing asbestos only

For priority waste consigned for disposal to landfill, the priority waste category determines:

- which landfills can receive the waste or, in the case of Category A waste, that the waste is prohibited from disposal to landfill without prior treatment
- the waste levy rate that applies to the waste

For soil, the priority waste category helps determine what can be done with soil more broadly, not just for disposal to landfill. For example, Category D soil generated at a project site may be contained on that site under a permit.

EPA Publication IWRG702 (EPA, 2009b), *Soil Sampling*, dated June 2009, provides guidance on the minimum soil sampling frequencies as follows:

1) One sample per 25 m^3 for soil volumes of less than 200 m^3 with a minimum of three samples; and

2) One sample per 250 m^3 for soil volumes of greater than 200 m^3 within a minimum of ten samples, where there is sufficient data to calculate the 95% upper confidence limit of the mean.

7.0 RESULTS OF SOIL INVESTIGATION

7.1 Subsurface Ground Conditions

A description of the main subsurface units encountered during our investigation is presented below. The depth range of the subsurface units encountered in HA02 and HA05 to HA08 are summarised in **Table 6**. Samples HA01, HA03 and HA04 were excluded from **Table 6** as the samples were taken on top of mounded area/stockpiles which do not represent the actual ground level of the site. Detailed bore logs are provided in Appendix D.

The fill in the stockpiles was described as clayey silt with trace gravel, and appeared to be a soil from the surrounding area rather than imported fill. Waste was not observed in the hand augers through the stockpiles.

Unit 1 – Fill

Fill was present from surface to depths of at least 0.65 m in HA02 (terminated in fill), 0.55 m in HA05 and 0.45 m in HA08. The fill consisted of clayey silt underlain by silty sandy gravel in HA02, and clayey silt underlain by gravelly clay/sandy clay in HA05 and HA08. The clayey silt fill layer encountered in the boreholes has trace of gravel except for HA05. There were no identified foreign materials in the fill encountered. The majority of the clay materials encountered had high plasticity.

Unit 2 – Natural

Natural layers of soil were encountered from surface up to the target depths in HA06 (up to 0.6 m) and HA07 (up to 0.7 m), and under a fill layer in HA05 (from 0.55 m to 0.75 m) and HA08 (from 0.45 m to 0.7 m). The natural soils consisted of brown, high plasticity clayey silt layer (up to 0.4 m in HA06/HA07) followed by brown/orange high plasticity silty clay (up to 0.6 m in HA06 and up to 0.7m in HA07). The natural layer encountered in HA05 and HA08 also consisted of a natural brown/orange high plasticity silty clay layer.

Perched water was encountered at a depth of 0.3 m in HA07 (near eastern boundary) and 0.5 m in HA02 (western boundary). Groundwater was not encountered in any of the boreholes.

Table 6: Depth range of subsurface units encountered in boreholes

Subsurface Unit	Depth range of subsurface units (m)				
	HA02	HA05	HA06	HA07	HA08
Unit 1 – Fill	Fill 0.0 – 0.65	Fill 0.0 – 0.55	-	-	Fill 0.0 – 0.45
Unit 2 – Natural	-	Natural 0.55 – 0.75	Natural 0.0 – 0.6	Natural 0.0 – 0.7	Natural 0.45 – 0.7

Note: Samples HA01, HA03 and HA04 were excluded from this table as the samples were taken on top of mounded area/stockpiles which do not represent the actual ground level of the site.

7.2 Field Analysis

Each sample was logged by the field scientist undertaking the sampling. An assessment of each soil sample was made in the field and involved ranking based on both olfactory and visible evidence of contamination. Each soil sample was given a ranking in accordance with Table 7.

Table 7: Environmental Ranking System for Soil Samples

Visible Contamination		Odorous Soil	
Rank	**Description**	**Rank**	**Description**
0	No visible evidence of contamination	A	No odour
1	Slight evidence of visual contamination	B	Slightly offensive odour
2	Visible contamination	C	Moderately offensive odour
3	Obviously contaminated	D	Strongly offensive odour

No visual or olfactory evidence of contamination was observed in the soil samples collected. Photoionisation detector (PID) readings of between 0.0 and 6 ppm were detected indicating a low risk of volatile organic compounds ion the samples screened.

No asbestos containing material (ACM) was observed during the works.

7.3 Laboratory Analytical Results

The current soil analytical results are presented in Table 1 (on-site land use) and Table 2 (off-site disposal) in Appendix E, and compared against the adopted investigation criteria outlined above. Laboratory certificates of analysis are presented in Appendix G.

7.3.1 Ecological Risk

No concentrations were reported above the adopted NEPM 2013 – EIL or ESL guidelines for a residential land use setting.

7.3.2 Human Health Risk

Concentrations of metals (arsenic, chromium, copper, lead, nickel and zinc), fluoride and Total Recoverable Hydrocarbons (TRH) C_{29}-C_{36} Fraction were reported above the laboratory's limit of reporting (LoR). However, the detected concentrations were all below the adopted NEPM (2013) human health HILs, HSLs and

Management Limits for the proposed residential use of the site. Therefore, based on the preliminary sampling, soils at the site are not likely to represent an unacceptable risk to human health (including short term exposure of construction workers).

7.3.3 Consideration of Buildings and Structure

The reported soil pH results ranged from 6 – 7.6 pH which represent a non-aggressive exposure classification for concrete or steel piles in clay soils above groundwater at the site. Chloride and sulphate were not analysed as part of this investigation, which may also impact on the exposure classification.

7.3.4 Consideration of Aesthetics

As noted above, an assessment of the aesthetic impacts in each soil sample was made in the field. No soil samples observations indicate an unacceptable impact to aesthetics. Anthropogenic materials including waste associated with identified burnt out rusted drums and a concrete slab (adjacent to HA02 sample) were found in the north-western portion of the site. These wastes and any other wastes identified should be removed prior to construction. The soil stockpiles identified onsite were not found to contain wastes and may be suitable for reuse subject to further assessment.

7.3.5 Production of Food, Flora and Fibre

The human health assessment discussed above is inferred to also represent the environmental value of production of food, flora and fibre.

7.3.6 Waste Disposal

The results of the laboratory analysis of the nine primary samples were within the threshold limits for Fill Material with the exception of HA03 (stockpile sample west of the large dam in the northwest portion of the site) where the concentration of fluoride was reported at 480 mg/kg which was above the 450 mg/kg Fill Material upper threshold limit. The fluoride may be of natural origin in the stockpiled materials.

Based on the available results, soil is likely to be classified as Fill Material for off-site disposal. The soil stockpile (HA03 area) has a preliminary classification of Category C Waste under EPA Publication 1828.2 but given the marginal exceedance, further sampling and statistical assessment may reduce this classification. There may be localised areas in the vicinity of the stockpiles and waste burning areas in the north-western portion of the site or potentially the homestead (once assessed) where localised contamination may be found impacting on the Fill Material classification. Once the volume of soil requiring off-site disposal is known, additional sampling and testing will be required to confirm this waste soil classification and satisfy the receiving site.

Prior to disposal of any material off-site, the nominated receiver should be contacted to verify that the material has sufficient soil quality data for them to accept the classification indicated within this report. The transport of all materials from the site should conform to the requirements of EPA Victoria, Local Council, VicRoads and any other relevant authorities.

The offsite disposal classifications for soils provided in this report are preliminary only and additional sampling, analysis and classification would be required to meet the requirements of EPA for classifying industrial waste and satisfy a landfill requirement for acceptance for disposal.

7.4 Data Quality Assurance

A data Quality Assurance (QA) program was implemented as part of the soil investigation. The main aspects of data QA relate to the field work procedures, collection of quality control samples (i.e. field duplicates) and generation of internal laboratory quality control data to support the reported results and the assessment of laboratory results.

The field work for this investigation was carried out in general accordance with Golder standard procedures which operates in accordance with AS/NZS ISO 9001:2000. The work was also carried out in general compliance with the Australian Standard AS 4482.1–2005 *"Guide to the Sampling and Investigation of Potentially Contaminated Soil, Part 1: Non-volatile and Semi-volatile Compounds", AS4482.2-1999 "Guide to the Investigation and Sampling of Sites with Potentially Contaminated Soil – Volatile Substances*".

The quality of the laboratory data generated was supported with appropriate laboratory Quality Control (QC) samples and assessed using standard methods. Internal laboratory QC samples including method blanks, laboratory duplicates, matrix spikes, laboratory control sample spikes and surrogate spikes were analysed as part of the quality assurance program.

The Data Quality Indicators (DQIs) for this assessment are required to meet the following acceptance criteria:

- Samples tested within holding time;
- Collection rate for primary duplicates at a rate of 10% of total primary samples analysed;
- Relative percentage differences (RPDs) for primary field duplicate to be generally less than 50%;
- All RPDs for laboratory duplicates less than 30%, or less than the dynamic acceptability range set by the laboratory based on daily tracking of data variability (refer to laboratory "QCI" report);
- Spike recovery for most analytes to fall in the range of 70 – 130%, or within the dynamic acceptability range set by the laboratory based on daily tracking of data variability (refer to laboratory "QCI" report);
- Laboratory method blanks to be below analyte LoR; and
- Overall completeness of at least 95%.

The laboratory report confirms that the samples were tested within holding time.

One primary duplicate sample was collected during the investigation and a total of nine primary samples were analysed. Duplicate testing was performed for select analytes consistent with the analytical program for the primary samples. The calculated RPDs for intra-laboratory duplicate and the rinsate blank analysis are presented in Table 3 and Table 4, respectively (refer to Appendix G).

Table 8: Soil QA/QC Summary for Soil Sampling

QC Sample Type	Number of Results NOT Meeting Data Quality Objectives	Total Number of Results (Individual Analytes)	Percentage Meeting Data Quality Objectives
Primary Duplicates	1	88	99%
Rinsate Blank	1	109	99%
Laboratory Internal Duplicates	0	189	100%
Matrix Spikes	1	92	99%
Method Blanks	0	175	100%
Laboratory Control Samples	0	89	100%
Overall Completeness	**3**	**742**	**99%**

The overall QA/QC completeness of 99% for soil results is above the overall objective of 95%. Based on this, it is considered that the overall data quality generated during the assessment of soils is of sufficient quality upon which to base decisions for this assessment.

8.0 RISK TO DEVELOPMENT

8.1 Nature of previous and existing land use

The site has a history of residential and agricultural use including potentially grazing and cropping of the land. Existing structures at the site include homestead infrastructure (house, shed, water tank) at the northeast boundary, the footprint of which has changed over time but within the same area on the site and general soil stockpiles, concrete slab, waste burning area and dams identified in the north-west portion of the site. No evidence of extensive use of imported fill or excavation was identified. Surrounding land use has been and remains agricultural or residential in nature with a former quarry located adjacent to the western site boundary.

8.2 Nature of contamination

All soil samples have reported concentrations below the adopted human health criteria for residential and public open space use indicating the site represents a low risk for the proposed residential land use. As access has not been granted to the homestead area where some of the key features of interest are there will remain a level of risk of contamination that cannot be assessed at this time.

Localised areas of contamination may exist on the site including in the areas around the homestead, stockpiles, waste burning areas and beneath the identified concrete slab in the north-west portion of the site. Broad area contamination is considered unlikely. No offsite sources of contamination were identified that are considered likely to impact upon the site condition.

The risk of groundwater contamination at the site is low. Furthermore, the risk of contamination impact to the site from offsite sources is considered to be low as no potentially contaminating activities were identified in the immediate surrounding areas.

8.3 Suitability for proposed residential development

Based on the findings of the site desktop assessment and current soil investigation, no contamination issues have been identified that are likely to preclude the proposed development of the site for a residential use.

In the fenced homestead area where soil investigation has not been undertaken due to access restriction, soil assessment of this area should be undertaken to confirm the need for remediation of the shallow soils. At this stage, there is potential that some shallow, localised remediation in this area will be required.

There will remain a level of uncertainty in relation to past activities over the site. It is therefore recommended that the uncertainty in the residual risk of contamination is managed via a general soil management protocol to be adopted during the development of the site (further discussed in Section 9.0).

8.4 Implications on offsite disposal options during development

Given the low risk of contamination identified it is likely that the near surface soil across the majority of the site is likely to classify as Fill Material for the purposes of offsite disposal. Concentrations of fluoride in the stockpile near the large dam may classify it as Category C waste for offsite disposal subject to further assessment.

Further sampling of soil stockpiles identified on site in the northwest should be undertaken to classify the stockpiled materials should these stockpiles be proposed for on-site reuse or off-site disposal.

Should offsite disposal of excess soil be required as part of the site development, further sampling of the excess material will be required to characterise it in accordance with the EPA publication 1828.2.

8.5 Implications on planning process and permitting

When considering the environmental process to be used to progress site development, consideration must be made of the requirements of *Ministerial Direction No.1 – Potentially Contaminated Land* that requires planning authorities to satisfy themselves that the environmental condition of the land to be used for a purpose is, or will be, suitable for that use.

Table 3 of the Practice Note Potentially Contaminated Land (DELWP, 2021) allows planners to consider the level of contamination at a site and the proposed land use to determine the level of environmental assessment required. Table 2 states the following regarding agricultural land use:

"While most agricultural land is not likely to be contaminated, the potential for specific contaminating activities to have occurred over time should be considered, including:

- *Commercial use of pesticides (including herbicides, fungicides etc)*
- *Biosolids application to land*
- *Farm waste disposal"*

There is limited evidence that any of these activities, or other medium or high contamination risk activities, have occurred at the site. In our assessment there is a low risk of contamination at the site which can be managed through the implementation of the recommendations set out in Section 10 of this report. As such, it is unlikely that further assessment will be required by the Planning Authority other than this assessment and completion of the recommended actions.

Should the Planning Authority assess the contamination potential as Medium, the Planning Authority may request a Preliminary Risk Screen Assessment (PRSA) by an Environmental Auditor (under Section 204 of the Environment Protection Act 2017) to:

- *assess the likelihood of the presence of contaminated land; and*
- *determine if an environmental audit is required; and*
- *if an environmental audit is required, to recommend a scope for the environmental audit.*

The PRSA is a new system in Victoria under the EP Act 2017. This report has confirmed that the contamination risks at the site are low and as such we would expect that a PRSA undertaken by an Environmental Auditor would likely come to a similar conclusion.

8.6 Environmental Duties

As specified in the Environment Protection Act (2017) which came into effect on 1 July 2021, the Duties for Contaminated Land apply to anyone in management or control of contaminated land and takes into consideration the Duty to Inform or General Environmental Duty (GED), Duty to Manage and Duty to Notify of Contamination. The Duties for Contaminated Land should be assessed considering the following:

1) **General Environmental Duty (GED):** relates to the 'state of knowledge' one has in relation to the risk of harm from an activity and the reduction of risks on human health or the environment.
2) **Duty to Manage (reduce the risk of harm):** expected when a person knows or ought to reasonably know that the land is potentially contaminated.

3) **Duty to Notify:** relates to notifiable contamination that requires management or control. If site sampling reports contaminants above human health investigation levels, the site is considered for Notification to EPA of contaminated land.

Based on the information to date, no contamination has been identified at the shallow soils across the site. As such, in our opinion the site is unlikely to be defined as contaminated land so that the GED would apply to the party in control of the land.

9.0 RECOMMENDATIONS

The following actions are recommended prior to or as part of development:

- Assessment of soil condition within the fenced homestead area in the north eastern portion of the site be undertaken through a program of shallow soil sampling to better assess soil condition around the site infrastructure and the need for remediation.
- Further sampling of soil stockpiles identified on site in the northwest should be undertaken to classify the stockpiled materials should these stockpiles be proposed for on-site reuse or off-site disposal.
- Once access is available, a HAZMAT survey should be undertaken at the homestead infrastructure area, and any identified ACM or other hazardous materials should be removed from site and disposed should demolition of the homestead infrastructure area be proposed. Following demolition of infrastructure, soil beneath the footprints should be inspected for signs of visual contamination or odour as validated by an Environmental Consultant.
- Identified anthropogenic materials (i.e. burnt, rusted drums and concrete slab in the northwest portion of the site) and other wastes if identified should be removed from site and visually verified as having been removed.
- There will remain a level of uncertainty in relation to past activities over the site. It is therefore recommended that the uncertainty in the residual risk of contamination is managed via a general soil management protocol to be adopted during the development of the site. The protocol would note:
  - The GED in relation to parties in control of the site;
  - Should any stained or odorous soils or soils containing waste be identified, that these are assessed by an Environmental Consultant;
  - All material suspected of being ACM should be assessed by a suitably qualified practitioner. Any ACM should be handled and disposed of by a suitably qualified and licenced asbestos contractor;
  - Any soil brought to site as fill are confirmed as meeting the EPA requirements for Fill Material; and
  - Any soil taken off-site meets the EPA requirements for the off-site disposal of soils.

10.0 IMPORTANT INFORMATION

Your attention is drawn to the document titled - “Important Information Relating to this Report”, which is included in Appendix H of this report. The statements presented in that document are intended to inform a reader of the report about its proper use. There are important limitations as to who can use the report and how it can be used. It is important that a reader of the report understands and has realistic expectations about those matters. The Important Information document does not alter the obligations Golder Associates has under the contract between it and its client.

APPENDIX B

Historical Aerial Photographs and Maps

1984 – The site was an open agricultural area. The dam in the northwest portion of the site was visible. No other infrastructure was present on site. The homestead infrastructure that currently exists on site was not yet visible in 1984. A quarry was present adjacent to the western boundary of the site.

1989 – The homestead infrastructure (main house and shed) was present in the northeastern part of the site. The dam in the northwest portion of the site had been enlarged. Another dam in the southern central portion of the site appeared. Stockpiles of soil were present in the northwest corner of the site. Construction was on-going to the southeast of the site.

2010 – Additional structures were present in the homestead area in the northeast portion of the site. A child care centre was present adjacent of the site to the east. Stockpiles of soil were still present in the northwest corner of the site and to the east and west of the large dam. The residential estate to the southeast of the site was completed.

2010 (zoomed aerial image of the homestead area) – The homestead area was grassed with mature trees and shrubs. Infrastructure includes a single story brick house (with associated water tank) in the southeast portion, main shed with an attached water tank to the north of the house and an unknown structure to the southwest corner.

Nov 2012 (zoomed aerial image of the homestead area) – Additional structures were present in the southwest portion of the homestead area (which appeared to be large containers).

Dec 2016 (zoomed aerial image of the homestead area) – Large structures present in the 2010-2012 photo in southwest portion of the homestead area were removed. Additional structure was present to the southwest of the main shed.

May 2019 (zoomed aerial image of the homestead area) – Additional structures (appeared to be shipping containers) were present to the southwest of the main shed. Stockpile of waste was present to the west of the added containers.

March 2020 – No significant change can be observed in the site except for the homestead area (shown in next image below).

March 2020 (zoomed aerial image of the homestead area) – Some structures in the northern portion were removed. There appeared to be a burnt waste in the northwest corner of the area,

April 2021 – No significant change can be observed in the site except for the homestead area (shown in next image below).

April 2021 (zoomed aerial image of the homestead area) – The previous structure in the northern portion was removed (where the footprint was visible in the photo). The likely burnt waste in the northwest portion was still visible. Additional structure was placed to the southwest of the main shed.

EXPLANATION OF NOTES, ABBREVIATIONS & TERMS USED ON BOREHOLE AND TEST PIT REPORTS

DRILLING/EXCAVATION METHOD

ADH	Hollow auger drilling	EX	Excavator	PQ3	Diamond core - 83 mm
ADT	Auger drilling with tc-bit	HA	Hand auger	PT	Push tube sampling
ADV	Auger drilling with v-bit	HAND	Excavated by hand methods	RAB	Rotary air blast
AIRCORE	Aircore	HMLC	Diamond core - 63 mm	RC	Reverse circulation
AT	Air track	HQ3	Diamond core - 61 mm	RD	Rotary Drilling
BH	Backhoe bucket	JET	Jetting	RT	Rock roller
CT	Cable tool rig	MZ	Mazier tube sampling	SONIC	Sonic drilling
DTC	Diatube coring	NDD	Non-destructive digging	SPT	Standard penetration testing
EE	Existing excavation	NMLC	Diamond core - 52 mm	U	Undisturbed tube sampling
EPT	Extruded push tube	NQ3	Diamond core - 45 mm	WB	Washbore drilling

PENETRATION/EXCAVATION RESISTANCE

L **Low resistance.** Rapid penetration possible with little effort from the equipment used.

M **Medium resistance.** Excavation/possible at an acceptable rate with moderate effort from the equipment used.

H **High resistance** to penetration/excavation. Further penetration is possible at a slow rate and requires significant effort from the equipment.

R **Refusal or Practical Refusal.** No further progress possible without the risk of damage or unacceptable wear to the digging implement or machine.

These assessments are subjective and are dependent on many factors including the equipment power, weight, condition of excavation or drilling tools, and the experience of the operator.

WATER

	Water level at date shown		Partial water loss
	Water inflow		Complete water loss

GROUNDWATER NOT OBSERVED	The observation of groundwater, whether present or not, was not possible due to drilling water, surface seepage or cave in of the borehole/test pit.
GROUNDWATER NOT ENCOUNTERED	The borehole/test pit was dry soon after excavation. However, groundwater could be present in less permeable strata. Inflow may have been observed had the borehole/test pit been left open for a longer period.

SAMPLING AND TESTING

SPT	Standard Penetration Test to AS1289.6.3.1-2004
4,7,11 N=18	4,7,11 = Blows per 150mm. N = Blows per 300mm penetration following 150mm seating
30/80 mm	Where practical refusal occurs, the blows and penetration for that interval are reported
RW	Penetration occurred under the rod weight only
HW	Penetration occurred under the hammer and rod weight only
HB	Hammer double bouncing on anvil
DS	Disturbed sample
BDS	Bulk disturbed sample
G	Gas Sample
W	Water Sample
FP	Field permeability test over section noted
FV	Field vane shear test expressed as uncorrected shear strength (sv = peak value, sr = residual value)
PID	Photoionisation Detector reading in ppm
PM	Pressuremeter test over section noted
PP	Pocket penetrometer test expressed as instrument reading in kPa
U63	Thin walled tube sample - number indicates nominal sample diameter in millimetres
WPT	Water pressure test
DCP	Dynamic cone penetration test
CPT	Cone penetration test
CPTu	Cone penetration test with pore pressure (u) measurement

RANKING OF VISUALLY OBSERVABLE CONTAMINATION AND ODOUR (for specific soil contamination assessment projects)

R = 0	No visible evidence of contamination	R = A	No non-natural odours identified
R = 1	Slight evidence of visible contamination	R = B	Slight non-natural odours identified
R = 2	Visible contamination	R = C	Moderate non-natural odours identified
R = 3	Significant visible contamination	R = D	Strong non-natural odours identified

ROCK CORE RECOVERY

TCR = Total Core Recovery (%)	RQD = Rock Quality Designation (%)	SCR = Solid Core Recovery (%)	F = Fracture Frequency
$= \frac{\text{Length of core recovered}}{\text{Length of core run}} \times 100$	$= \frac{\sum \text{Axial lengths of core} > 100\,\text{mm}}{\text{Length of core run}} \times 100$	$= \frac{\sum \text{Length of cyclindrical core recovered}}{\text{Length of core run}} \times 100$	$= \frac{\text{No. of defects}}{\text{Length of zone (m)}}$

METHOD OF SOIL DESCRIPTION USED ON BOREHOLE AND TEST PIT REPORTS

SYMBOLS

FILL

GRAVEL (GW, GP, GM or GC)

SAND (SW, SP, SM or SC)

SILT (ML or MH)

CLAY (CL, CI or CH)

ORGANIC SOILS (OL, OH or Pt)

COBBLES or BOULDERS

Combinations of these basic symbols may be used to indicate mixed materials such as sandy clay.

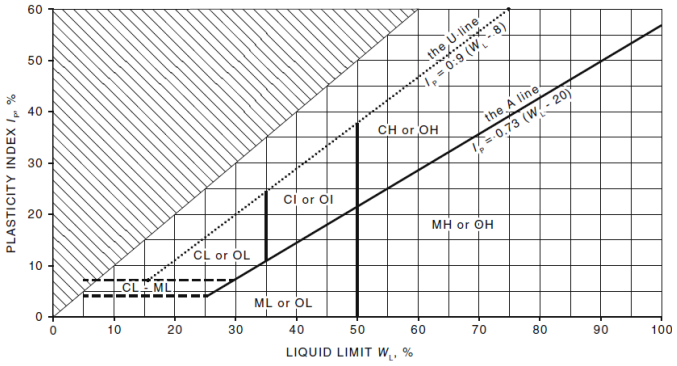
CLASSIFICATION AND INFERRED STRATIGRAPHY

Soil and Rock is classified and described in Reports of Boreholes and Test Pits using the preferred method given in AS1726-2017. The material properties are assessed in the field by visual/tactile methods.

Particle Size

Soil Group	Sub Division	Particle Size
BOULDERS		> 200 mm
COBBLES		63 to 200 mm
GRAVEL	Coarse	19 to 63 mm
	Medium	6.7 to 19 mm
	Fine	2.36 to 6.7 mm
SAND	Coarse	0.6 to 2.36 mm
	Medium	0.21 to 0.6 mm
	Fine	0.075 to 0.21 mm
SILT		0.002 to 0.075 mm
CLAY		< 0.002 mm

Plasticity Properties



MOISTURE CONDITION

Symbol	Term	Description
D	Dry	Sands and gravels are free flowing. Clays and silts may be brittle or friable and powdery.
M	Moist	Soils are darker than in dry condition and may feel cool. Sands and gravels tend to cohere.
W	Wet	Soils exude free water. Sand and gravels tend to cohere.

Moisture condition for fine grained soils is described relative to the plastic limit or liquid limit as specified in AS1726-2017.

CONSISTENCY AND DENSITY

Fine Grained Soils

Symbol	Term	Undrained Shear Strength
VS	Very Soft	0 to 12 kPa
S	Soft	12 to 25 kPa
F	Firm	25 to 50 kPa
St	Stiff	50 to 100 kPa
VSt	Very Stiff	100 to 200 kPa
H	Hard	Above 200 kPa
Fr	Friable	-

Coarse Grained Soils

Symbol	Term	Density Index (%)	SPN "N" *
VL	Very Loose	Less than 15	0 to 4
L	Loose	15 to 35	4 to 10
MD	Medium Dense	35 to 65	10 to 30
D	Dense	65 to 85	30 to 50
VD	Very Dense	Above 85	Above 50

In the absence of test results, consistency and density may be assessed from correlations with the observed behaviour of the material.

* SPT correlations are not stated in AS1726-2017, and may be subject to corrections for overburden pressure and equipment type.

CEMENTATION

Weakly Cemented	The soil may be easily disaggregated by hand in air or water.
Moderately Cemented	Effort is required to disaggregate the soil by hand in air or water.

APPENDIX F

EILs Derivation

Inputs
Select contaminant from list below
Cr_III
Below needed to calculate fresh and aged ACLs
Enter % clay (values from 0 to 100%)
10
Below needed to calculate fresh and aged ABCs
Measured background concentration (mg/kg). Leave blank if no measured value
or for fresh ABCs only
Enter iron content (aqua regia method) (values from 0 to 50%) to obtain estimate of background concentration
or for aged ABCs only
Enter State (or closest State)
VIC
Enter traffic volume (high or low)
low

Outputs		
Land use	Cr III soil-specific EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	#NUM!	140
Urban residential and open public spaces	#NUM!	410
Commercial and industrial	#NUM!	670

Inputs
Select contaminant from list below
Cu
Below needed to calculate fresh and aged ACLs
Enter cation exchange capacity (silver thiourea method) (values from 0 to 100 cmolc/kg dwt)
10
Enter soil pH (calcium chloride method) (values from 1 to 14)
6.8
Enter organic carbon content (%OC) (values from 0 to 50%)
1
Below needed to calculate fresh and aged ABCs
Measured background concentration (mg/kg). Leave blank if no measured value
or for fresh ABCs only
Enter iron content (aqua regia method) (values from 0 to 50%) to obtain estimate of background concentration
or for aged ABCs only
Enter State (or closest State)
VIC
Enter traffic volume (high or low)
low

Outputs		
Land use	Cu soil-specific EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	#NUM!	75
Urban residential and open public spaces	#NUM!	200
Commercial and industrial	#NUM!	290

Inputs
Select contaminant from list below
Ni
Below needed to calculate fresh and aged ACLs
Enter cation exchange capacity (silver thiourea method) (values from 0 to 100 cmolc/kg dwt)
10
Below needed to calculate fresh and aged ABCs
Measured background concentration (mg/kg). Leave blank if no measured value
or for fresh ABCs only
Enter iron content (aqua regia method) (values from 0 to 50%) to obtain estimate of background concentration
or for aged ABCs only
Enter State (or closest State)
VIC
Enter traffic volume (high or low)
low

Outputs		
Land use	Ni soil-specific EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	#NUM!	35
Urban residential and open public spaces	#NUM!	170
Commercial and industrial	#NUM!	290

Inputs
Select contaminant from list below
Zn
Below needed to calculate fresh and aged ACLs
Enter cation exchange capacity (silver thiourea method) (values from 0 to 100 cmolc/kg dwt)
10
Enter soil pH (calcium chloride method) (values from 1 to 14)
6.8
Below needed to calculate fresh and aged ABCs
Measured background concentration (mg/kg). Leave blank if no measured value
or for fresh ABCs only
Enter iron content (aqua regia method) (values from 0 to 50%) to obtain estimate of background concentration
or for aged ABCs only
Enter State (or closest State)
VIC
Enter traffic volume (high or low)
low

Outputs		
Land use	Zn soil-specific EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	#NUM!	130
Urban residential and open public spaces	#NUM!	440
Commercial and industrial	#NUM!	670

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Vic EPA 1828.2 Table 3 (Solids)			
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Aug 31, 2021	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Aug 31, 2021	14 Days
- Method: LTM-ORG-2010 TRH C6-C40

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Semivolatile Organics	Melbourne	Aug 31, 2021	7 Days
- Method: USEPA SW 846 8270			
Metals M8	Melbourne	Aug 31, 2021	180 Days
- Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Authorised by:

Michael Morrison	Analytical Services Manager
Emily Rosenberg	Senior Analyst-Metal (VIC)
Joseph Edouard	Senior Analyst-Organic (VIC)

Sample Receipt Advice

Company name:	Golder Associates Pty Ltd (Richmond)
Contact name:	Maroun Faddoul
Project name:	ROSS WATT RD GISBORNE
Project ID:	21473472
Turnaround time:	5 Day
Date/Time received	Aug 30, 2021 1:37 PM
Eurofins reference	820569

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of a random sample selected from the batch as recorded by Eurofins Sample Receipt : 7.8 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Michael Morrison on phone : 03 8564 5933 or by email: MichaelMorrison@eurofins.com

Results will be delivered electronically via email to Maroun Faddoul - MFaddoul@golder.com.au.

Note: A copy of these results will also be delivered to the general Golder Associates Pty Ltd (Richmond) email address.

APPENDIX H

Important Information

The document ("Report") to which this page is attached and which this page forms a part of, has been issued by Golder Associates Pty Ltd ("Golder") subject to the important limitations and other qualifications set out below.

This Report constitutes or is part of services ("Services") provided by Golder to its client ("Client") under and subject to a contract between Golder and its Client ("Contract"). The contents of this page are not intended to and do not alter Golder's obligations (including any limits on those obligations) to its Client under the Contract.

This Report is provided for use solely by Golder's Client and persons acting on the Client's behalf, such as its professional advisers. Golder is responsible only to its Client for this Report. Golder has no responsibility to any other person who relies or makes decisions based upon this Report or who makes any other use of this Report. Golder accepts no responsibility for any loss or damage suffered by any person other than its Client as a result of any reliance upon any part of this Report, decisions made based upon this Report or any other use of it.

This Report has been prepared in the context of the circumstances and purposes referred to in, or derived from, the Contract and Golder accepts no responsibility for use of the Report, in whole or in part, in any other context or circumstance or for any other purpose.

The scope of Golder's Services and the period of time they relate to are determined by the Contract and are subject to restrictions and limitations set out in the Contract. If a service or other work is not expressly referred to in this Report, do not assume that it has been provided or performed. If a matter is not addressed in this Report, do not assume that any determination has been made by Golder in regards to it.

At any location relevant to the Services conditions may exist which were not detected by Golder, in particular due to the specific scope of the investigation Golder has been engaged to undertake. Conditions can only be verified at the exact location of any tests undertaken. Variations in conditions may occur between tested locations and there may be conditions which have not been revealed by the investigation and which have not therefore been taken into account in this Report.

Golder accepts no responsibility for and makes no representation as to the accuracy or completeness of the information provided to it by or on behalf of the Client or sourced from any third party. Golder has assumed that such information is correct unless otherwise stated and no responsibility is accepted by Golder for incomplete or inaccurate data supplied by its Client or any other person for whom Golder is not responsible. Golder has not taken account of matters that may have existed when the Report was prepared but which were only later disclosed to Golder.

Having regard to the matters referred to in the previous paragraphs on this page in particular, carrying out the Services has allowed Golder to form no more than an opinion as to the actual conditions at any relevant location. That opinion is necessarily constrained by the extent of the information collected by Golder or otherwise made available to Golder. Further, the passage of time may affect the accuracy, applicability or usefulness of the opinions, assessments or other information in this Report. This Report is based upon the information and other circumstances that existed and were known to Golder when the Services were performed and this Report was prepared. Golder has not considered the effect of any possible future developments including physical changes to any relevant location or changes to any laws or regulations relevant to such location.

Where permitted by the Contract, Golder may have retained subconsultants affiliated with Golder to provide some or all of the Services. However, it is Golder which remains solely responsible for the Services and there is no legal recourse against any of Golder's affiliated companies or the employees, officers or directors of any of them.

By date, or revision, the Report supersedes any prior report or other document issued by Golder dealing with any matter that is addressed in the Report.

Any uncertainty as to the extent to which this Report can be used or relied upon in any respect should be referred to Golder for clarification
